

Visual Paging System

The Visual Paging system is used in the offices or workplace where an Public Address system is not appropriate. Audible messages are too intrusive in the workplace or cannot be heard in the workshop or yard.

A three digit number is assigned to each person (usually the last three numbers of their extension number)

The Operator keys in the number, on the control unit, when that person cannot be contacted at their desk. By phone.

The Paging Display is placed in convenient locations throughout the complex. The display of the number is preceded by an announcement tone. The number is displayed for 30 seconds. Should a second page be initiated while the first one is still being displayed, the numbers rotate until the first number times out.

The person being paged then uses a nearby extension to call the operator and connect to the caller or receive a message.

There are two types of display.

- A 100mm super bright 7 segment LED display. (Internal)
- A 150mm yellow, mechanical 7 segment display. (External)
