

Data Switch

The Data Switch is used where there are insufficient I/O ports on the PABX system to connect all the required terminal equipment. The Data Switch is placed between the PABX port and the terminal equipment i.e. Printer, MAT Terminal etc.

The Data Switch also connects to a Modem to allow external access to the PABX port.

When the modem port becomes active the Data Switch disconnects the terminal equipment and connects the PABX directly to the modem.

When transmission is completed the Data Switch returns to its idle state.

This switch can be used on Networks, where data collection of TMS information may be required.
