

Music On Hold Interface

In many PABX and Key system installations it is desirable to have Music on Hold.

There are often problems with Volume and Impedance mismatch, particularly when the music source is located remotely to the PABX.

This Interface provides the correct input impedance and with the internal amplifier, the correct volume level can be achieved.

Features:

Two part Isolation & Amplification

Notes:

Only part A required if music source is close to the PABX (Item No. 1160)

Only part B required if volume control is not required (Item No. 1162)
